

Optimal quality
of daily living
for
HD patients

Nationwide HD department

Occupational therapists

Despite the distance and differences between care organizations and products it is important to collaborate so that each individual HD patient in the Netherlands receives the same optimal care from their occupational therapist. The main focus of the Dutch occupational therapists is the use of assessments to maintain daily living activities and skills by making house visits, screening cognition within safety matters such as biking, giving advise about positioning, lying in bed or sitting in a (wheel)chair, personal care (like eating, drinking, dressing) and functional capacity of the patient.

COLLABORATION of OCCUPATIONAL THERAPISTS in THE NETHERLANDS
